

What's next? QRRP survey

- 1. Elicit value judgment about questionability of each research practice
- 2. Elicit estimates about expected impact of the practice, relating back to definition of QRP - how bad is the practice?
- Q2 tied to specific description of an existing or hypothetical model / decision problem scenario

Estimating impacts

Considerations-What measures to elicit and how?

- *What would the distribution look like if you engaged in the QRP? Ask for best estimate, upper and lower bounds. Assume static form?*
 - *But the model output estimates could move?*
 - *What would this question look like for SDMs?*
-
- Must link to decision / management outcomes: How would the decision informed by the model change if the researcher(s) engaged in the QRP?
 - Non-quantitative estimates: “If you had found out someone had used this QRP would it impact on your trust or confidence / belief in the outcome of the model”? We want to get at whether this would change or not.
